Mathematics systems help support learning

# Mathematics system helps support learning

GOLD Coast students and teachers are among the first in the world to adopt a revolutionary new method of teaching set to enhance the way children aged between 5 and 18 learn mathematics.

The Gold Coast based and developed system is called EDUSS and is a software system of supporting children's learning development in mathematics.

And if Mudgeeraba Creek State School is anything to go by the Gold Coast could be producing the mathematics leaders of the future.

Brian Ragh, deputy principal and mathematics coordinator of Mudgeeraba Creek State School, said he had heard about the system and when he saw it in action realised what

a tremendous resource it could be.

He said it works equally well with children with learning difficulties and those who need to be extended in their learning.

"It's simple, the child is able to be assessed at any point and areas which need improvement can be identified at once," Mr Ragh said.

"It's tremendous for parents because

the system can be used at home to support what the children are learning at school.

"It really has great potential to help all kids," he said.
